

Forward Simulation of Optimal Hiring (Calmar fit: $\xi = 6.041$, $a_0 = 200.00$)
 $\alpha_0 = 1.64$ (best campaign minus SPY). Left: \$1M book — interior optimum. Right: \$10M book — boundary (capacity constraint missing)

$K_0^{\text{dep}} = \$1\text{M}$: optimal staffing ($n_0 = 1$, no hires)

$K_0^{\text{dep}} = \$10\text{M}$: optimal staffing ($n_0 = 2$, no hires)
